

Perplexity Space: PAL Skill Builder

This package configures a Perplexity Space to create consistent, ROSTR-compatible `SKILL.md` files. Add `PROJECT_INSTRUCTIONS.md` to the Space instructions. Keep the templates and scripts in the Space files so every future skill can use the same contract and validation.

Included files

- `PROJECT_INSTRUCTIONS.md` — paste/import as the Space’s project instructions.
- `SKILL_SPEC_TEMPLATE.md` — canonical skill format.
- `MANIFEST_TEMPLATE.yaml` — registry record for a generated skill.
- `scripts/new_skill.py` — generates an individual skill folder from the template.
- `scripts/validate_skill.py` — validates front matter and required sections.
- `scripts/build_index.py` — creates a Markdown registry from skill folders.
- `examples/research-target-planning/SKILL.md` — reference implementation.

Workflow

1. Add the project instructions and templates to a Perplexity Space named `PAL Skill Builder`.
2. Ask: “Build a skill for <capability>. Target harness: <harness>. Inputs: <...>. Output: <...>.”
3. Review assumptions and approve any optional scope, external tool access, or consequential actions.
4. Save the generated skill to `skills/<skill-id>/SKILL.md` and add its manifest entry.
5. Run `validate_skill.py` locally or in CI. Build a registry with `build_index.py`.

Suggested request

Build a ROSTR skill for validating Supabase migration plans. It should accept a migration
